Summary

B.Tech AI & Data Science student focused on backend engineering. Built Spring Boot microservices and event-driven pipelines with RabbitMQ, Redis, and PostgreSQL. Cut API response time 38% at Retech Solutions; co-led backend direction and built the core scheduling algorithm for a project used by 700+ students.

Technical Skills

Languages: Java, Python, SQL

Backend: Spring Boot, REST APIs, Microservices, RabbitMQ, Redis

Databases & Security: PostgreSQL, Hibernate ORM, JWT, OAuth 2.0

Tools: Docker, Postman, Git, GitHub Actions, JUnit

ML: scikit-learn (TF-IDF, Linear SVM)

Fundamentals: DSA (220+ problems, LeetCode), SOLID, System Design

Work Experience

Retech Solutions Pvt. Ltd.

Dec 2024 – Jan 2025

Software Engineering Intern

Remote, India

- Reduced API response time from 800ms to 500ms (38%) by designing and implementing a Redis caching layer, owned end-to-end from design through deployment
- Trained and tuned a TF-IDF + Linear SVM intent classifier (scikit-learn) on labeled customer-support queries across order-status, refund, cancellation, and payment intents; integrated it into the production chatbot backend for real-time intent routing
- Wrote JUnit tests for backend service components and integrated the chatbot backend with the frontend via RESTful APIs, supporting reliable feature delivery

Projects

DevSecWatch | Spring Boot, FastAPI, RabbitMQ, Redis, Docker

Jan – Mar 2026

- Architected a 4-service security scanning platform independently: GitHub Actions CI pipeline plus an event-driven RabbitMQ pipeline running Docker-sandboxed Semgrep workers, keeping API response times under 100ms
- Implemented stateless JWT authentication with role-based authorization protecting all endpoints; added an LLM-powered remediation service backed by Redis, resolving cache-invalidation bugs causing stale results

PlanWizz | Spring Boot, Java, CSP with Backtracking

Dec 2025

- Led the technical decision to migrate the backend from a JS prototype to Spring Boot after validating the scheduling-conflict problem as significant with a team of 4; designed and implemented a CSP scheduling engine using backtracking search with constraint propagation over inconsistent, PDF-parsed enrollment data
- Resolved competing constraints – day-off preferences, time-block exclusions, course-load limits – algorithmically; deployed to 700+ registered students at Saveetha Engineering College, cutting manual enrollment time from roughly an hour to 2-5 minutes

TriNetra AI | Android (Kotlin), Spring Boot, RabbitMQ, Redis

2026

- Designed a multi-service evidence-reconciliation architecture for e-commerce return disputes: Android edge client (CameraX, Room, WorkManager) capturing real-device evidence, feeding a Spring Boot verdict service with deterministic Serial/IMEI verification and PASS/REVIEW/HOLD decisioning
- Prototype stage with core capture and reconciliation logic implemented and tested end-to-end; API authentication is the next hardening milestone, not yet enforced

Education

Saveetha Engineering College

Chennai, Tamil Nadu

B.Tech – Artificial Intelligence and Data Science, CGPA: 8.16/10

Sep 2023 – May 2027

Achievements

HackHustle 2.0 – 2nd Prize (2026): Team of 4, TriNetra AI – pivoted mid-hackathon from a weak customer-only framing to a full supply-chain evidence model that won

No Code Rush – 2nd Prize (2025): Team of 3 – built the backend and student-profile schema for an AI career guidance platform, using an LLM to reason over scraped course/job data

Best Event Award, Drestein 2026: Organized “Prompt Sprint Launch” (50+ participants); judged teams on how they used AI, not just output
